Howell Network White Paper

Introduction & Brief

Introduction:

The Howell Idea / Blockchain was birth as a result of passion for blockchain technology and the belief in its ability to enhance finance, bring about financial freedom, Enable Swift and Easy Cross Border Payment, Secure and digitalize data, etc.

In past experiences, we have come across a series of blockchain projects that tend to paint blockchain technology bad, Unsecured, Unstable, Not sustainable, Inefficient, and Very Volatile.

Here we put all-out energy, our all to make sure we use the blockchain and cryptocurrency for what it was meant for, Favorable to all trustworthy, and Solid following the due process while being fully aware and prepared for the risks.

In this article, we would be going through our plans, Projects, and Community Structure together with proofs and links to our platforms and materials. Do well to read carefully, be informed, and contact us with any questions and doubts.

Brief:

The Howell Network is an EVM-supported Blockchain Built On Cosmos SDK and Tender mint with Proof of Stake Consensus Mechanism our Base Currency is the SHEER

Currency which would function as an investment token and be used to pay gas fees on our network.

We are geared toward creating a cryptocurrency that can be adopted by the masses for transactions and payments, and the volatility of cryptocurrencies has been a hindrance to this therefore we are creating a Stable Token on the Howell Blockchain which would be utilized for payments and transactions and would be backed by the SHEER coin.

This stable coin would be used for transactions on all our platforms, the more the use of this token is adopted the more the value of the SHEER currency increases.

Our platforms are platforms that provide goods and services that would be needed on a daily bases we aim to drive the usage of our currencies through these platforms thereby increasing the values and also making profits on services provides, more would be discussed on these topics below.

About Howell Network (Technical)

The Howell Network is an EVM-supported Blockchain Network Built On top of Cosmos SDK and Tendermint with the proof of stake consensus mechanism, this network would be having two major currencies the SHEER as the base currency for blockchain governance and the stable currency () which would not be pegged to any fiat currency, the major aim of this currency is to facilitate transactions on our various platforms, this stable currency would be backed by the SHEER coin and the algorithm is structured in a way that the value of the SHEER coin increases with increasing adoption of the Stable coin, therefore, we envision a linear/exponential growth, our platforms to be built on this blockchain are to be fashioned in a way as to drive daily traffic and usage of our currencies which would be discussed below.

The stable coin is an algorithmic stable coin
The Howell Network is a decentralized network with no central authority, no regulation from banks, and a secure blockchain with high utility

Community and Social Platforms

Community:

We are embarking on a very large and fun project that would be needing great support from a very vibrant community therefore we are very keen on building a community to support the project and build around it.

We also have lots and lots of amazing projects to build that would be needing arms and expertise in various fields so therefore we are also very keen on building a developer community.

We have existing online and offline communities growing organically and steadily that as brought this project to the point it is now and we would love for all to support and enhance the project in any way possible.

Social Platforms:

- Discord Community
- Telegram Group
- Telegram Channel
- Reddit Community
- Twitter
- Telegram Developers Community
- Medium

Our Goals

- To enhance the adoption of cryptocurrencies
- To Provide and Good Investment Platform for Investors
- To make an impact in various countries across Africa and Abroad
- To make money and opportunities available to many
- To alleviate poverty
- To reduce the huddle of cross-border payments

Our Mission

- Making Blockchain technology adoptable globally for transactions and payments

Our platforms

Talking about adoption and usage we would be creating platforms and innovative technologies that would enhance usage by providing quality services both online and offline in strategic locations and areas based on studies and feasibility, below are a few platforms with MVPs developed by our dev team to be backed by the Howell blockchain:

Smart Con - A multivendor E-commerce services / Restaurant Platform: This is a platform that connects restaurants, retail / wholesale stores, and service providers to their customers, basically products and services are listed under various vendors on the platforms, and users can view and order for products/services using their coins while we

handle the logistics, this platform would be functional in Nigeria and we would expand further as we gain capacity and with respect votes on our POS blockchain.

S-shop - Single Vendor E-commerce Store: This is a normal e-commerce platform where we would be selling our products, our brands, our innovations, etc.

Workify or SmartLancer - Freelancing Platform: Since the covid-19 pandemic there have been a rise in the traffic to various freelancing platforms and many genuinely talented users, due to high competition are unable to participate on already existing platforms some of these freelancing platforms are having challenges managing their servers and user we are here to take our share of the market and also We have noticed the huddle in getting paid as a freelancer on other platforms, especially for new and upcoming freelancers, we aim to solve that problem by creating a freelancing platform where all transactions happen on the blockchain, freelancers would be paid with our stable currency reducing the huddle and heavy charges from third party withdrawal platforms.

S-NFT - NFT marketplace for ticketing and digitalization of data HIP721/HIP1155: This platform is an NFT trading platform that would be used for digitalization of data and also for ticketing, as it would be accompanied by our smart machine that can validate users based on our ticketing protocol, we would go all our in introducing this innovation to various organizations as such innovations are not really in use in most African organizations.

S-swap - DEX (Decentralized Exchange / Fork of Pancake-swap): A swapping and staking platform to enhance the accessibility of various currencies o the Howell blockchain, it is a decentralized swapping protocol

Wallet / Staking / Governance Platform: This platform is our custom wallet that would have special features for staking, voting, governance, etc.

Life - A Gaming Platform: This gaming platform is a big project and would be done as time goes on, but presently analyses are being done on the game and some characters are being built, the game is a mission game that showcases life in general centered around a young Male or Female who's part can be chosen by the players and different challenges are given to the player to combat, the various paths a player can choose consists of being a gang star, pastor, footballer, student, etc This game would have Metaverse features whereby users can buy and sell properties, it would also have multiplayer features. The idea behind the game is one being able to live the life he wants and wishes and aspires to live, together with all the fantasies in the Metaverse world and it also helps in educating the minds of the players.

Pin Ball - Gambling / Gaming Platform on the blockchain: This is a platform where users can gamble their money by selecting the right colors and numbers with the right selection you either gain or lose money.

Blog / Community (Twitter-like with extended features):
This is our community platform like a social platform where people can interact, ask questions, share their problems and coins can be gifted, videos can be shared, etc.

Forums: This platform is basically for questions and answers with regards to the Howell Network user/participants can lay compliant, give suggestions, and give insight on this platform.

Foundation: This is one of our core platforms that involves helping humanity, reaching out to the less privileged, and impacting them. Provision of food, knowledge, shelter, and technology. The foundation is also one of our strategies for expansion

Every one of these platforms has a development team and testers + smart contract auditors working hard to make it awesome and solid you can view links to MVPs below:

Each of these projects is individual standalone and modular and are Byzantine fault-tolerant managed by separate dedicated teams fashioned and trained to make their tasks solid and successful
